	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Working code that uses real-time math equations to calculate the student's grade ● Student will need to find the percentage grade of each category and implement it into the system beforehand ● A data system that captures the student's data and stores it for that specific student ● An interface that is eligible and works well enough for the student to navigate the website (no GUI/ text-based)	**Schedule - (For V2.0+)** ● Beautiful GUI that is simple but effective enough for the student to navigate the website ● Using student emails and student names to store data ● Allowing the student to enter every individual grade, while the program does all of the calculations itself ● Erasing all data before the next semester starts
Not Important	**Delegate - (Use a library)** ● A data website that stores real-time data and protects it ● Coding it first in Java, then carrying	**Delete - (Cut it)** ● An AI that calculates the grades for you ● Assignments that have been marked as 0

	the code over to JavaScript ● A program that asks the student how many graded assignments there are, while the student inputs each graded assignment (IO.readln(); or something similar)	before being assigned ● A system that can be implemented straight through Brightspace when grades are automatically filtered ● Data that is stored forever
